

Outreach Platform: Product & Technical Roadmap

1. Product Summary

The outreach platform will focus on five core systems:

1. **Finding the right leads**
2. **Personalizing outreach**
3. **Managing deliverability and sender health**
4. **Running automated multi-channel sequences**
5. **Tracking results and suggesting improvements**

The product should make these systems work together.

A user should be able to give us their business information, define who they want to reach, find the right prospects, generate personalized messages, launch a sequence, and see what is working.

The long-term product should handle more of the work automatically instead of making the user configure every part of the outreach process.

2. Competitive Landscape

The current market gives us a good list of features that users already expect.

The important competitors and what we can learn from them:

GMass

Features

- Native Gmail integration
- Google Sheets integration
- Spam Solver
- External SMTP routing

- Threaded conversation tracking

What we can use

Gmail and Google Workspace integration can make the product easier to use because users already work there.

Google Sheets integration can also be useful for importing leads and custom variables.

Spam testing can become part of our future deliverability system.

External SMTP and multiple sending infrastructure can become useful when we scale.

Priority

Long term

3. Apollo

Features

- Large B2B lead database
- Filters for company, industry, location, size, etc.
- Buyer intent data
- AI sequence generation
- Automated warmup
- CRM integrations
- Chrome extension
- Prospecting from websites and LinkedIn

What matters most for us

The database and lead filtering are extremely important.

One of the biggest problems for outreach users is simply finding the right people.

A user might have thousands or millions of possible prospects. They need to know which ones are worth contacting first.

This is why **AI Lead Filtering should be part of the MVP.**

The system should take available prospect data and rank leads based on how closely they match the customer's ICP and how likely they are to be relevant.

Example:

Lead A

- Strong ICP match
- Correct job role
- Relevant company
- Strong recent activity

→ High priority

Lead B

- Correct industry
- Reasonable company fit
- Weak role match

→ Medium priority

Lead C

- Poor ICP match

→ Low priority

The scoring system can become more advanced as we collect more campaign data.

Priority

MVP

4. Saleshandy

Features

- AI Sequence CoPilot
- AI-generated opening lines
- Real-time content scoring
- Spam-word detection
- Readability checks

- Multiple sender accounts
- Sender rotation
- Email verification

What we can use

The important idea here is that AI should not only generate the message.

The system should also evaluate it.

For example:

- Is the opening too generic?
- Is the message too long?
- Is the CTA clear?
- Does the message actually relate to the prospect?
- Are there spam-risk phrases?
- Is the message readable?

This becomes part of our future **Outreach Scoring & Suggestions** system

5. Instantly

Features

- Instantly Copilot
- Context-aware AI copy
- Large sender infrastructure
- Unified inbox
- AI lead filtering
- Multiple sending accounts

Important idea for our product

The Mailbridge-style company knowledge base idea can make the personalization much deeper.

We can store information about the customer's company, products, services, target customers, positioning, and other business information.

Then we research the individual prospect.

For each prospect, the system can look at:

- Job title
- Company
- Company information
- Public profile
- Recent activities
- Relevant announcements
- Other available information

The system then determines which part of the customer's product or service is most relevant to that person.

For example:

A company may have five different products.

The prospect is a Head of Sales.

The system identifies that Product #2 is most relevant to that role.

The message focuses on Product #2 instead of randomly mentioning the company or listing all five products.

That is the type of personalization we want.

Priority

Core product direction

The basic version can start in MVP. The deeper company/prospect intelligence system can expand over time.

6. PlusVibe

Features

- Deliverability setup guidance
- Personal vs custom-domain detection
- Email verification
- Lead enrichment
- Warmup

- Inbox rotation
- Engagement simulation

What we can use

Deliverability should be handled inside the product.

The user should be guided through things like:

- SPF
- DKIM
- DMARC
- Domain configuration
- Email verification
- Sender health
- Sending limits
- Warmup

As the platform grows, more of these processes can become automated.

Priority

Phase 2

7. Lemlist

Features

- Personalized images
- Personalized landing pages
- Personalized video thumbnails
- LinkedIn sequences
- Email + LinkedIn + phone sequences
- Website retargeting

What we can use

Dynamic media can become a later personalization layer.

Once text personalization is working well, we can add:

- Personalized images

- Screenshots
- Video thumbnails
- Landing pages

Multichannel sequences are also part of the long-term product.

Priority

Phase 3

8. Smartlead

Features

- Large-scale sender infrastructure
- Agency infrastructure
- Automated spam recovery
- Custom AI integrations
- Large numbers of sending accounts

Feature we should study closely

Automated spam recovery.

The platform can monitor sender performance and detect when an inbox or domain starts performing badly.

The system can then:

- Reduce sending
- Pause sending
- Move traffic to healthier sending infrastructure
- Adjust campaign behavior
- Alert the user when manual action is required

This can become one of our strongest infrastructure features.

9. MVP

The MVP should have a small number of systems that are actually useful from day one.

MVP 1: AI Lead Filtering

This is one of the most important features.

The user provides a lead database.

Our system processes the available information and ranks prospects.

Possible inputs:

- Name
- Job title
- Company
- Industry
- Company size
- Location
- Company information
- Intent signals
- Engagement history
- Other available enrichment

The output is a prioritized lead list.

For example:

High Priority

- Strong ICP match
- Relevant role
- Relevant company
- Strong available signals

Medium Priority

- Reasonable match
- Some relevant signals

Low Priority

- Weak ICP match
- Weak relevance

The user can then start outreach with the highest-value leads first.

This feature directly addresses one of the biggest problems in outreach: **bad lead selection**.

10. MVP 2: Campaign Builder

The campaign system needs to handle the basic outreach workflow reliably.

The user should be able to:

1. Select leads
2. Create a campaign
3. Write or generate the first message
4. Add follow-ups
5. Set delays between steps
6. Start the campaign
7. Detect replies
8. Stop the sequence when someone replies
9. Track basic results

The initial sequence builder can be simple.

Example:

Day 1

Email

↓

Day 3

Follow-up

↓

Day 7

Follow-up

↓

Day 12

Final follow-up

Later we can add behavior-based triggers and multiple channels.

11. MVP 3: Business + Prospect Intelligence

The personalization engine should be built around two sets of information.

Customer information

The user can provide:

- Website
- Product information
- Sales documents
- PDFs
- Company descriptions
- Existing messaging
- Internal documents
- ICP information
- Brand voice examples

The system extracts:

- What the company sells
- Who it sells to
- What problems it solves
- Product benefits
- Ideal customer profile
- Tone of voice
- Relevant terminology

Prospect information

For each prospect, we collect available information from permitted sources.

This can include:

- Profile information
- Job role
- Company
- Company activities
- Recent public information
- Company website
- Relevant business events
- Other available context

The system combines both datasets.

Then it determines:

What should we actually talk to this prospect about?

That information goes into the Claude API prompt.

12. Claude API Personalization

Claude will be used as the main message-generation layer.

The system prompt and supporting logic should contain rules for:

- Writing style
- Message length
- Personalization
- Avoiding generic AI language
- Avoiding unnecessary compliments
- Avoiding obvious templates
- Using real prospect context
- Matching the customer's voice
- Keeping the message relevant to the prospect
- Using the correct product or feature for that prospect

The model receives:

Customer business data

-

Customer ICP

-

Customer voice

-

Product information

-

Prospect information

-

Prospect-specific research

Personalized outreach message

The message should sound like a sales person who actually researched the prospect.

The system should also be able to repeat this process for follow-ups.

13. Outreach Scoring & Suggestions

This becomes one of the intelligence layers of the platform.

The system tracks campaign performance.

Basic metrics can include:

- Sent
- Delivered
- Opened where reliable
- Replies
- Positive replies
- Meetings
- Bounces
- Unsubscribes

The system then analyzes performance.

Instead of only showing:

Reply rate: 2.4%

it can eventually provide suggestions such as:

- "This sequence is getting opens but very few replies."
- "The opening line is too generic."
- "Shorter messages are performing better for this audience."
- "This CTA is producing fewer replies."

- "Prospects in this role are responding better to Product A."
- "Follow-up #2 is producing more replies than follow-up #1."

The system becomes a feedback loop:

Send → Measure → Analyze → Suggest → Improve → Send again

This can become a major long-term advantage because the product gets better at understanding what works.

14. Deliverability

Deliverability becomes a major part of the platform after the MVP.

Features:

Automated Warmup

Gradually increase sending volume and maintain healthy sending behavior.

Inbox Rotation

Spread campaigns across multiple sending accounts when appropriate.

SPF / DKIM / DMARC

Help users configure domain authentication correctly.

Email Verification

Detect invalid, disposable, and other risky addresses before sending.

Sender Health

Monitor:

- Bounce rates
- Spam signals
- Sending volume
- Reply behavior
- Domain health
- Inbox health

Deliverability Testing

Test messages before large campaigns where possible.

15. Automated Social Warming

Social outreach can eventually have its own warming system.

The basic idea from the original concept is to avoid needing massive email infrastructure just to establish activity.

Accounts can interact with other accounts in a controlled warming process.

For example:

- Profile activity
- Normal interactions
- Messages between controlled accounts
- Other platform-supported actions

The implementation has to follow the rules and limits of the specific platform.

The engineering problem is making the warming process reliable without requiring the user to manually manage every account.

Once the account is sufficiently established, the user can use it for their actual outreach.

This is a later-stage system.

16. Automated Multi-Channel Sequences

The long-term sequence engine should support multiple channels inside one workflow.

Example:

Day 1

Email

↓

Day 3

LinkedIn action

**Day 5**

Email follow-up

**Day 8**

LinkedIn message

**Day 12**

Final email

Everything is tracked against the same prospect.

The user should be able to see the entire sequence in one place.

Later channels can be added as integrations become available.

17. Dynamic Media Personalization

After text personalization is strong, we can add:

- Personalized images
- Dynamic screenshots
- Personalized video thumbnails
- Personalized landing pages

The same prospect intelligence can determine what content should be shown.

For example:

A prospect uses a specific product.

The system generates a screenshot or message showing how our customer's product relates specifically to that workflow.

This turns personalization from text-only into a full outreach experience.

18. Lead Database

A proprietary lead database could become one of the biggest competitive advantages.

The target range discussed is:

50M to 300M leads

The database needs to handle:

- Collection
- Normalization
- Deduplication
- Verification
- Enrichment
- Updating
- Company matching
- Person matching
- Data freshness

Potential data sources:

- Licensed data
- Public information
- First-party data
- Enrichment providers
- Crawling where permitted
- Other data sources

Technologies such as **Scrapy** and **BeautifulSoup** can be used for parts of the crawling pipeline.

They are tools for collecting data. They do not solve the database problem by themselves.

The database architecture will need systems for:

Collection → Processing → Verification → Enrichment → Storage → Search → Updating

The important metric should be **useful and accurate leads**, not simply the total number of records.

19. Lead Database + AI Filtering

The real value comes from combining the database with the lead-scoring system.

For example:

Database:

100M prospects

↓

ICP filtering

↓

Company filtering

↓

Role filtering

↓

Enrichment

↓

Prospect intelligence

↓

AI scoring

↓

Top 50,000 prospects

↓

Personalized outreach

This is much more useful than simply giving the user access to a huge database.

20. Automated Spam Recovery

This should eventually become a major infrastructure system.

The platform continuously watches sender performance.

If an account starts showing poor reputation signals:

Detect problem

↓

Reduce or stop sending

↓

Identify healthier sender

↓

Redirect campaign where appropriate

↓

Continue monitoring

↓

Recover account

The user should see the important information without needing to manually monitor every inbox.

This feature could become a strong differentiator for high-volume customers and agencies.

21. Unified Inbox

A later version should have one inbox for all connected sending accounts.

Instead of checking:

- Gmail account #1
- Gmail account #2
- Gmail account #3

- Gmail account #4

the user sees the replies in one place.

Each conversation remains connected to:

- Prospect
- Company
- Campaign
- Sequence
- Sending account
- Previous messages

This can eventually extend across multiple channels.

22. Future Integrations

Long-term integrations can include:

- Gmail
- Google Workspace
- Google Sheets
- Salesforce
- HubSpot
- Zapier
- REST APIs
- Other CRM systems

A Chrome extension can also be considered for collecting prospect information from supported websites and workflows.

These integrations become more important once the core platform is stable.

23. Feature Priority

MVP

Lead Intelligence

- AI Lead Filtering
- Lead scoring
- ICP matching
- Basic enrichment

Campaigns

- Sequence builder
- Multi-step email sequences
- Follow-ups
- Reply detection
- Basic campaign analytics

AI

- Claude API integration
- Business-data ingestion
- ICP understanding
- Customer voice understanding
- Prospect research
- Personalized message generation
- Personalized follow-ups

Basic Tracking

- Delivery
 - Replies
 - Positive replies
 - Bounces
 - Campaign performance
-

24. Phase 2

Deliverability

- Email warmup
- Inbox rotation
- SPF/DKIM/DMARC assistance
- Email verification
- Sender health
- Deliverability testing

AI

- AI sequence generation
- AI follow-up generation
- Real-time content scoring
- Spam-risk detection
- Readability analysis
- Better prospect recommendations

Infrastructure

- Multiple sender accounts
 - Unified inbox
 - Better campaign management
-

25. Phase 3

Multichannel

- LinkedIn workflows
- Social outreach
- Unified multi-channel sequences
- Cross-channel tracking

Personalization

- Personalized images
- Screenshots
- Video thumbnails
- Landing pages

Data

- Larger proprietary database
 - Better enrichment
 - Better company matching
 - Better prospect matching
-

26. Phase 4

Advanced Infrastructure

- Automated spam recovery
- Automated sender health management
- Large-scale sender infrastructure
- Advanced reputation monitoring
- Automated campaign traffic management

Intelligence

- Cross-campaign learning
 - Performance-based suggestions
 - Prospect-specific recommendations
 - Message optimization based on historical results
-

27. Five Core Systems

The entire product can be understood through five systems.

1. Lead Intelligence

Find the right people.

Database + enrichment + ICP matching + AI scoring.

2. Personalization

Understand the customer and the prospect.

Business data + prospect research + Claude + prompt rules.

3. Deliverability

Keep campaigns running safely.

Warmup + verification + sender health + rotation + reputation monitoring.

4. Outreach Automation

Run the campaign.

Sequences + follow-ups + multiple channels + unified inbox.

5. Outreach Intelligence

Understand what is working.

Tracking + scoring + recommendations + campaign learning.

28. Technical Architecture Direction

At a high level, the system can be broken into these layers:

Data Layer

Stores:

- Companies
- Prospects
- Contacts
- Products
- ICP information
- Customer business data
- Campaign data
- Historical outreach

Research / Enrichment Layer

Collects and processes available information about:

- Companies
- Prospects
- Activities
- Relevant events

Intelligence Layer

Handles:

- ICP matching
- Lead scoring
- Prospect relevance
- Product-to-prospect matching
- Personalization context

AI Layer

Claude API handles:

- Message generation
- Follow-ups
- Personalization
- Content analysis
- Suggestions

Campaign Engine

Handles:

- Sequence execution
- Timing
- Follow-ups
- Reply detection
- Multi-channel steps

Deliverability Layer

Handles:

- Verification
- Warmup
- Sender health
- Rotation
- Reputation monitoring
- Recovery

Analytics Layer

Handles:

- Campaign performance
- Reply rates
- Positive replies
- Meetings

- Bounce rates
 - Channel performance
 - Message performance
-

29. The Long-Term Product Flow

The full system eventually looks like this:

Customer business data

Understand company + products + ICP + voice

Lead database

Find matching companies

Find matching prospects

Enrich prospect

Research prospect

Determine relevant product / feature

Generate personalized message

Run sequence

Email / social / other channels

Track response

Score performance

Generate suggestions

Improve future outreach

That creates a continuous system rather than a simple email sender.

30. Engineering Priorities

Since engineering resources are limited, the build order should be:

- 1. Lead data model**
- 2. AI Lead Filtering**
- 3. Campaign and sequence engine**
- 4. Business-data ingestion**
- 5. Prospect research/enrichment pipeline**
- 6. Claude personalization engine**
- 7. Reply detection**
- 8. Basic campaign analytics**

- 9. Deliverability infrastructure**
- 10. Outreach scoring and suggestions**
- 11. Multichannel sequences**
- 12. Large proprietary lead database**
- 13. Automated spam recovery**
- 14. Dynamic media personalization**
- 15. Deep ecosystem integrations**

The first release should be usable without all of the later infrastructure.

31. What The MVP Needs To Prove

The MVP needs to answer four practical questions:

1. Can we find better leads?

If AI Lead Filtering consistently produces a better prospect list, that is valuable.

2. Can we generate better personalization?

If the system can understand the customer and prospect well enough to produce relevant messages, that is valuable.

3. Can we run campaigns reliably?

Sequences, follow-ups, replies, and tracking need to work without constant manual intervention.

4. Can we show users what is working?

Basic analytics should show enough information to improve campaigns.

If these four pieces work, we have the foundation for the rest of the platform.

32. Final Product Direction

The product eventually becomes:

Lead database + AI lead selection + prospect research + personalized messaging + campaign automation + deliverability infrastructure + performance intelligence.

The five main product areas remain:

Better leads

Better personalization

Better deliverability

Better automation

Better feedback

The competitive advantage comes from connecting all five.

A prospect is found in the database.

The system decides whether they fit the customer's ICP.

It researches the prospect.

It identifies the customer's product or feature that is most relevant.

Claude generates the message using the customer's business information and voice.

The campaign engine sends the sequence.

The deliverability system manages sender health.

The analytics system measures the result.

The recommendation system learns from the result and suggests what to change.

That is the full product loop.

Find → Understand → Personalize → Send → Measure → Improve.

That is the system we should build.
